a second strand bound to the flanking sequence, wherein said second strand comprises a polynucleotide corresponding to said first strand and to a target molecule.

3. (Amended) The cassette of claim 1, wherein said protein of interest emprises a toxin.

- (Amended) The cassette of claim 1, wherein said target is unique to neoplastic 4. cells.
- 5. (Amended) A method for inhibiting the growth of neoplastic cells, said method comprising contacting said cells with a masked expression cassette comprising a double stranded nucleic acid molecule.

wherein a first arrand comprises an RNA sequence which codes for a protein of interest linked downstream of a flanking sequence, and a translation initiation site operably inserted upstream of the RNA sequence; and,

a second strand bound to the flanking sequence, wherein said second strand comprises a polynucleotide corresponding to said first strand and to a target molecule.

(Amended) A method for controlling the expression of a protein of interest in the 10. presence of a target molecule, sald method comprising contacting a cell comprising the target molecule with a masked expression cassette comprising a double stranded nucleic acid molecule, wherein a first strand comprises an RNA sequence which codes for a protein of interest linked downstream of a flanking sequence, and a translation initiation site operably inserted upstream of the RNA sequence; and

a second strand bound to the flanking sequence wherein said second strand comprises a polynucleotide corresponding to said first strand and to the target molecule.
